Owner: Limerick Park

PIC: Not Specified

Project: General Laboratory Testing (Fee for Service)

Species: Feed

Samples Received: 3 x Feed

Date Collected:

Date Received: 06-Nov-2020

Submission:

Notes regarding the submission of fresh hay and pasture samples for ARG T

The interpretation of the test results is **absolutely dependent** on how the sample supplied was collected. Ideally the sample should be a combination of sub-samples from all over the paddock or from at least two sides of a hay bale. Even with ideal sampling, "hot" spots may be missed. For a risk assessment the sample should be representative of the feed animals consume. Animals on low to moderate risk paddocks or fodder should be observed daily. Animals should be removed from high risk pastures or feed.

The test results of **green samples** do not necessarily reflect the true levels of ARG T after drying off of the pasture. There is the possibility that the ARG T levels may increase.

Serology Results

Test Type: **Quantitative ARG T ELISA; Hay, Pasture & Fodder**

Date Tested: 10/11/2020

Spec No	Spec ID	Spec Description	Result
0001	Pdk 1 Brunswick Rolls	Feed	Not detected - No Risk (On average less than 1 gall/kg in sample supplied)
0002	Pdk 2 Roelands Squares	Feed	Not detected - No Risk (On average less than 1 gall/kg in sample supplied)
0003	Pdk 3 Brunswick Squares	Feed	Not detected - No Risk (On average less than 1 gall/kg in sample supplied)
